36 week ironman training plan

Published: September 3, 2026 | Index ID: #-

Introduction

Training for an Ironman is a life changing challenge that demands commitment, discipline, and a well structured plan. Whether you're a seasoned triathlete or a novice looking to push your limits, a 36 week training program offers the ideal balance between progressive overload and recovery. In this guide we break down every phase, workout, and strategy that will help you transform your training from "I can't finish" to "I just finished." By the end, you'll have a clear, actionable roadmap that fits into your busy schedule and keeps you injury free.

What Is an Ironman?

An Ironman triathlon consists of a 2.4 mile (3.86 km) swim, a 112 mile (180.25 km) bike ride, and a 26.2 mile (42.20 km) marathon run. The race is renowned for its grueling distance and the mental toughness it demands. Because of its complexity, athletes typically train for 6–12 months, with the longest period of structured training lasting around 36 weeks.

The 36 Week Advantage

Why 36 weeks? This duration gives you ample time to:

- Build a solid aerobic base without risking overtraining.
- Gradually increase intensity and volume in a controlled manner.
- Integrate strength, flexibility, and mental training.
- Recover fully before the race and reduce injury risk.

Training Principles for a 36 Week Plan

Before diving into weekly schedules, understand the core principles that underpin any successful Ironman program.

1. Progressive Overload – Gradually increase mileage and intensity.
2. Periodization – Organize training into distinct phases.
3. Recovery – Allocate sufficient rest to allow adaptation.
4. Cross Training – Use complementary activities to enhance performance.
5. Nutrition & Hydration – Fuel the body for endurance and recovery.
6. Equipment Familiarity – Train with the gear you'll use on race day.
7. Mindset – Develop mental strategies to stay focused and resilient.

Phases of a 36 Week Ironman Training Plan

A 36 week program is usually broken into four main phases: Base, Build, Peak, and Taper. Each phase serves a specific purpose and has distinct training characteristics.

Base Phase (Weeks 1 12)

The foundation of your training. The goal is to develop aerobic endurance and muscular endurance while keeping intensity low.

- Weekly mileage: 90–120 /miles (bike), 3–5 /miles (run), 2–3 /mi (swim).

- Focus on long, slow distance (LSD) sessions.
- Introduce strength training (core, hips, shoulders).
- Learn proper nutrition during long rides and runs.

Build Phase (Weeks 13 24)

Intensity rises. You'll start incorporating interval training, tempo workouts, and brick sessions (bike to run transitions).

- Weekly mileage: 120–160 /miles (bike), 5–8 /miles (run), 3–5 /mi (swim).
- Introduce tempo swims, threshold runs, and interval bike sessions.
- Start race specific nutrition plan.
- Work on bike run transitions and pacing strategies.

Peak Phase (Weeks 25 30)

This is the most intense period. You'll hit your highest weekly mileage and incorporate race specific workouts.

- Weekly mileage: 160–200 /miles (bike), 8–12 /miles (run), 5–7 /mi (swim).
- Simulate race conditions with long brick sessions.
- Fine tune pacing and nutrition.
- Focus on maintaining strength and flexibility.

Taper Phase (Weeks 31 36)

The goal is to reduce volume while maintaining intensity to arrive fresh for race day.

- Weekly mileage: 80–120 /miles (bike), 6–8 /miles (run), 3–5 /mi (swim).
- Keep intensity high but reduce duration.
- Prioritize recovery: sleep, massage, mobility work.
- Visualize race day and finalize logistics.

Weekly Training Structure

Below is a sample weekly layout that balances volume, intensity, and recovery. Adjust the days based on your personal schedule.

1. Monday – Rest or Active Recovery

   Light swim or yoga, 30–45 /min.
2. Optional foam rolling.

- Swim: 1,200–1,800 /ft (or 45–60 /min) focusing on technique.
- Strength: 30 /min core and lower body focus.

- Bike: 60–90 /min with 4–6 intervals of 3–5 /min at threshold.
- Run: 20–30 /min easy after bike.

- Run: 8–12 /mi at an easy pace.
- Swim: 30–45 /min easy, focus on breathing.

- Bike: 90–120 /min at tempo pace (comfortably hard).
- Core: 20 /min (planks, side planks, Russian twists).

- Bike: 3–5 /h at a steady pace.
- Run: 2–3 /mi immediately after bike.

- Swim: 1,500–2,000 /ft or 60–75 /min focusing on distance.

- Optional: 20 /min easy bike or walk.

Key Workouts Explained

Understanding the purpose behind each workout type ensures you’re training efficiently.

Long Slow Distance (LSD) Sessions

These sessions build aerobic capacity and muscular endurance. Keep the pace comfortable, usually 60–70% of your maximum heart rate.

Tempo Workouts

Tempo workouts train you to sustain a hard effort for an extended period. Target 80–85% of max HR or a perceived exertion of 7–8/10.

Interval Training

Intervals improve VO , max and lactate threshold. Typical structure: 4–6 repeats of 3–5 min at high intensity with equal or slightly longer recovery.

Brick Sessions

Simulate race transitions. Bike for 60–90 min followed immediately by a 15–20 min run to adapt your legs to the switch.

Strength & Conditioning

Focus on core stability, hip strength, and upper body endurance. Use bodyweight or light weights to avoid overloading.

Nutrition & Hydration Strategy

Nutrition is the fuel that powers your training and recovery. A balanced plan includes macronutrient timing, electrolytes, and race day fueling.

Daily Macros

- Carbohydrates: 55–65% of total calories.
- Protein: 15–20% to aid muscle repair.
- Fats: 20–25% for sustained energy.

During Long Workouts

- Consume 30–60 /g carbs per hour.
- Use electrolyte drinks to replace sodium, potassium, and magnesium.
- Practice your race day fueling routine during training.

Recovery Nutrition

Within 30 minutes post workout, aim for a 3:1 carb:protein ratio. Example: chocolate milk, a banana with peanut butter, or a recovery shake.

Gear & Equipment Checklist

Training with the same gear you’ll use on race day reduces surprises and improves performance.

- Triathlon bike with a comfortable fit.

- Run shoes with good cushioning and support.
- Swim goggles and a wetsuit (if required).
- Bike computer or GPS watch.
- Proper nutrition packs for long rides and runs.
- Recovery tools: foam roller, massage stick, compression sleeves.

Mental Preparation

Endurance events test your mind as much as your body. Incorporate these mental techniques into your routine.

Visualization

Spend 5–10 /min daily picturing race day: the course, the crowds, the finish line.

Goal Setting

Set short term (weekly) and long term (race) goals. Track progress in a training log.

Mindfulness & Stress Management

Practice breathing exercises or meditation to stay calm under pressure.

Injury Prevention & Recovery

Injuries derail training. Follow these guidelines to stay healthy.

- Warm up & Cool down: Always spend 10–15 /min warming up and cooling down.
- Mobility Work: Stretch major muscle groups daily.
- Strength Balance: Strengthen weaker muscle groups to prevent imbalances.
- Rest Days: Treat them as active recovery, not idle time.
- Listen to Your Body: Address pain early with rest or professional care.

Sample 36 Week Training Calendar

Below is a condensed view of how weeks might progress. For a full calendar, download our printable PDF (link).

Weeks 1 4 (Base)

- Bike: 90 /mi/week
- Run: 25 /mi/week
- Swim: 3 /mi/week
- Strength: 2×/week

Weeks 5 8 (Base Continuation)

- Bike: 110 /mi/week
- Run: 30 /mi/week
- Swim: 4 /mi/week
- Strength: 2×/week

Weeks 9 12 (Build Begins)

- Bike: 130 /mi/week
- Run: 35 /mi/week
- Swim: 5 /mi/week
- Strength: 2×/week

Weeks 13 16 (Build)

- Bike: 150 /mi/week
- Run: 40 /mi/week
- Swim: 6 /mi/week
- Strength: 2×/week

Weeks
